

Viadal Event Planner

Problem Statement, MVP Scope & C4 Level 1 Context

Working title · v0.2 · 2026-06-18 · Owner: Peter Thorn (product lead) · Dev: Frida Bredberg

1 Problem Statement & MVP Scope

Problem

Organizers of multi-day endurance events plan and run their events today on spreadsheets, paper, and scattered messaging. Officials, schedules, workstation duties, participant details, and results live in disconnected places. This causes version confusion, manual handoffs, and fragile execution on event day. There is no single, reliable system to configure an event, invite and schedule officials against workstations and timeslots, give participants their own information, and communicate reliably with both groups. Viadal is the design driver, but the same coordination problem exists across small sport events run by small organizing teams.

Vision

A multi-tenant web platform where any event organizer can configure their event, invite and schedule officials, give participants a personal view, link to results, and communicate with officials and participants through SMS-backed announcements. Timing and results stay with **Race Results**; the platform embeds links to their pages and does not compute timing in-house. The platform is built for multiple commercial tenants and multiple feature tiers from day one.

Target market

Event organizers running small sport events with a race office, a venue, officials staffing workstations on a schedule, and external timing. The platform is multi-tenant from day one, and the domain model is kept **event-neutral** (event type is a configured attribute) so a swim meet and Viadal are the same model with different configuration. Tournament-format events are explicitly post-MVP, not part of v1.

Actors

Human roles: **System admin** (manages tenants across the platform: activation/deactivation, feature toggling); **Tenant admin / Event admin** (manages a single tenant/event, configures it, manages officials, publishes announcements, unlimited admins in v1); **Official / funktionär** (invited via SMS, assigned to workstations, to-do lists and timeslots); **Participant / deltagare** (read-only event info plus a personal view with bib/category and Race Results link).

External systems: **Race Results** (authoritative timing and results via embedded links, possibly multiple per participant group) and the **SMS provider** (delivers official invites and

notifications, selected by Frida, no email fallback in v1). One tenant equals one event in v1, and the tenant name equals the race name.

MVP scope (in)

1. **Event creation and configuration:** dates, distances, event type, location, facilities, logo, description.
2. **Officials:** registration via SMS invite, management, and assignment scheduling (workstations, to-do lists, timeslots).
3. **Participant view:** event info, facilities, location, schedule and Race Results links, plus a personal view showing their own bib/category and a link to their Race Results page.
4. **Results tracking:** via embedded Race Results links. No in-house timing logic.
5. **Communication:** two separate announcement channels (participants and officials), admin-publish only, with SMS notifications on by default and opt-out in personal account settings.
6. **System admin layer:** tenant management, activation/deactivation, feature toggling per tenant.
7. **Personal account view** for all authenticated users: mobile number, name, schedule (officials), bib/category and Race Results link (participants), notification settings.

Cross-cutting and non-negotiable from day one: multi-tenant isolation; i18n with i18next or equivalent (English default and only language in v1, no hardcoded UI strings); per-tenant feature-toggle infrastructure for standard/premium/professional tiers (only one tier active in v1).

Out of scope for v1 (post-MVP)

- Visitor role (unauthenticated public access); multiple events per tenant; tenant admin count limitations.
- Satellite map view; merch and promo partners; open chat groups where all participants can post; official signup waitlist.
- Tournament event type; email as a communication channel.
- In-house timing or results computation (owned by Race Results); C4 model levels 3 and 4; formal card sorting and multi-round user testing.

Success criteria

- The Viadal 2026 edition is planned and executed on the platform.
- At least one tenant/event is configured by an organizer other than Peter, with no code changes.
- The SMS invite and notification flow works end to end for officials and participants.
- No event-specific, sport-specific, single-tenant, or single-tier assumption is hardcoded anywhere.

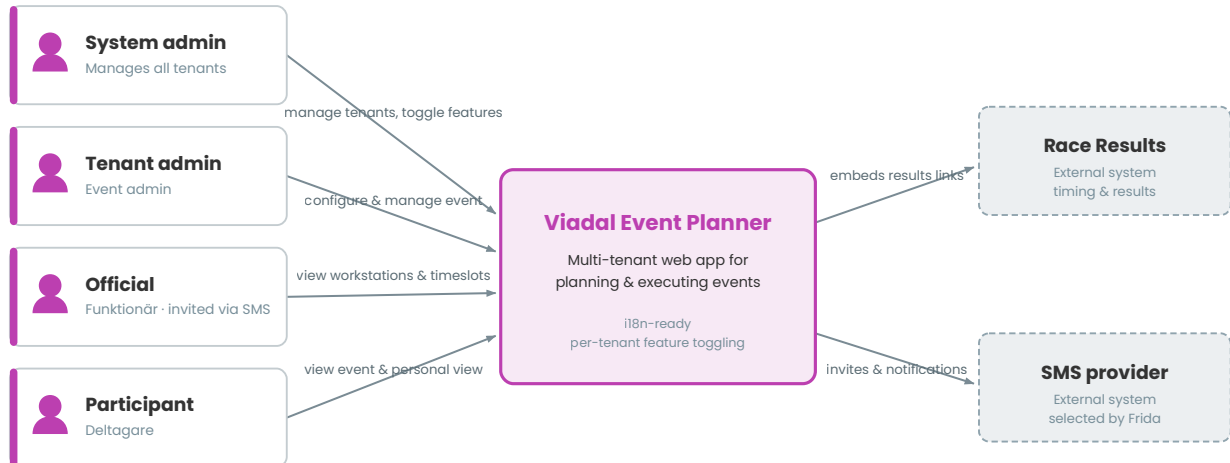

Key constraints and decisions

Stack: React + TypeScript, fullstack, patterns suited to Claude Code-assisted development. Team of two, scope kept pragmatic. Deadline: the Viadal 2026 edition. SMS provider

selected by Frida, no email fallback. **Multi-tenant, i18n-ready, and per-tenant feature toggling** are the three non-negotiable architectural requirements.

2 C4 Level 1 – System Context

The platform as a single system, with all external actors and systems. Used to align scope and boundaries before design and build begin. The authoritative source is maintained as a Mermaid file in the repository ([docs/c4/level1-context.mermaid](#)).

Note: the SMS provider delivers invites and notifications to officials and participants.

Participants also view their results directly on Race Results via embedded links. One tenant = one event (v1); tenant name = race name.

System Context diagram — Viadal Event Planner

Relationships

From	To	Interaction
System admin	Platform	Manages tenants, activation/deactivation, feature toggling
Tenant admin	Platform	Configures event, manages officials, publishes announcements
Official	Platform	Views workstations, to-do lists and timeslots
Participant	Platform	Views event info and personal view
Platform	Race Results	Embeds links to timing and results pages
Participant	Race Results	Views results via embedded links
Platform	SMS provider	Sends invites and announcement notifications
SMS provider	Official / Participant	Delivers invites and notifications via SMS
